Self Priming Horizontal Pumps SVA

Applications

The self priming side channel rotary pumps of SVA range are intended to pump drinking or service water without mechanical impurities up to 90°C.

These small side-channel pumps are spread broadly, especially they are suitable for domestic water supply pumps. They are used for water supply in housings, cottages, for spray irrigation of gardens and anywhere else in the case that suction head including losses in pipeline does not exceed 8m.

The pumps are used to handle flammable liquids of I-IV class. For this purpose the sizes 20 and 32 are equipped with mechanical seal.

It is possible to use these pumps also for pumping oils of kinematic viscosity up to 37 mm².s⁻¹.

Description

The pumps of SVA range are of rotary, self priming, side-channel, horizontal design coupled with flexible coupling to driving motor.

The pump consists of suction body, discharge body, suction insert, discharge insert, bearing housing, stuffing box cover, shaft with impellers and bearings.

The suction branch is arranged above horizontal axis of the pump so that the pump is always flooded with pumped liquid. The suction body is equipped with filling plug and drain plug. The discharge branch is pointed upward vertically. The suction and delivery inserts including impellers in number depending on the pressure required are put between the suction body and the discharge body. This subassembly is clamped with clamping bolts. The shaft at suction side is supported on sliding bush (bearing) which is cooled with pumped liquid. The shaft at discharge side is supported on ball bearing. The shaft is sealed with gland rope packing, that is pressed with stuffing box cover and two bolts, or with mechanical seal.

The pumps are supplied with counterflanges including sealings and bolts.

The pumps 25-SVA-ME and 32-SVA-ME are of close-coupled design without standard base plate.

The pumps 32-SVA-ME are assembled from:

- self priming pump
- connecting piece
- electric motor

The connecting piece makes connection of the pump to the electric motor with flexible coupling possible and at the same time it serves as foot of the "monoblock pumping unit". The pump is driven with electric motor size of which depends on number of pump stages.

Direction of Rotation

The pumps of SVA range are counterclockwise turning unit viewing from drive side.

Material

The suction body, the discharge body, the suction and discharge inserts, the bearing housing, the stuffing box cover and the flanges are made from grey cast iron, the impellers are made from brass and the shaft is made from structural steel. The sliding bush is made from sintered metal. Gland packing rope or mechanical seal is made from material depending on pumped liquid.

Accessories

The pumps are supplied with counterflanges including sealings and bolts. Holes in suction and discharge body for connection of pressure gauge or vacuum gauge are plugged.

Range of Delivery

The pumps can be supplied in several ranges following acc. to Czech standard ČSN 110021.

- range 1 - the pump only with bare end shaft
- range 9 - the pump coupled with complete flexible coupling to electric motor mounted on common base plate

To customer's special order we can supply:

- range 2 - the pump with complete flexible coupling
- range 3 - the pump with complete flexible coupling and with common base plate for pump and electric motor, but without the motor
- The pumps 25, 32-SVA-ME of close-coupled design without standard base plate.

When ordering, please advice:

- characteristic of application
- kind and temperature of pumped liquid
- size and pump type
- operating voltage
